

PureLuxe — End-to-End Product Flow

For: Founder / product leadership

What this is: The full PureLuxe product in simple language — pages, use cases, examples, and how each screen looks.

What this is not: A technical document (no code, APIs, or database design).

Note: This describes the full product. I have described the **internal team system in detail, end to end**, as our first focus will be on building the internal team system.

Big picture (read this first)

PureLuxe has **two products** and **two different websites**.

They share the same trip information underneath, but they look and feel different on purpose.

Product	Website	Who uses it	Simple meaning
PureLuxe Studio	Team website (example: studio....)	Internal team (advisors, ops, finance)	The office tool to plan, book, and manage trips
PureLuxe Client App	Guest website (example: app....)	Guests / travelers	Chat-based booking for clients — plan, choose, approve, pay, and get support in one conversation

Why two different websites?

1. **Different use cases** — Studio is for daily ops work (queue, bookings, margins, commissions). The Client App is for chat based booking, guest review, approval, payment, and travel support.
2. **Different theme / look** — Studio feels like a work tool. The Client App feels like a warm luxury guest experience. Mixing both in one UI confuses people.
3. **Different login** — Team uses Google / company login. Guests use a separate guest login. They must never share the same access world.
4. **Safer for clients** — Guests should never see internal pages (costs, margins, queue, supplier tools).
5. **Clearer brand** — Each site can have its own domain, design, and first impression.
6. **Easier to grow later** — You can update or redesign the guest site without disturbing the team's daily Studio workflow.

Same codebase (important for build)

Even though there are **two websites**, we start with **one single Next.js repo / one codebase**.

Why this is a good approach (especially for a solo developer):

1. **Faster to build** — one project, one setup, one deploy pipeline to learn.
2. **Shared trip logic stays correct** — both sites use the same trip, client, booking, and payment rules (no double entry, no sync bugs).
3. **One database** — Studio and Client read/write the same trip truth.
4. **Less maintenance** — fix a trip status once; both products benefit.
5. **Still two websites in real life** — same repo can power two domains/deployments (Studio site + Client site).
6. **Can split later if needed** — if the team grows, you can separate UI apps. You do **not** need two repos from the beginning.

Simple way to remember

Two websites for users.
One codebase and one trip database for the builder.

Important rule

The internal team can run and manage the full trip in Studio.
The client / customer can also **book a trip through AI agent chat** in the Client App (chat-based booking).
In that chat journey, the client can plan, choose options, review, approve, pay, and ask for help.
Studio still remains the system of record for quality checks, commercial control, supplier booking execution, and operations.

This document explains Studio first (in full detail).
Then it explains the Client App, and how the two connect.

Fixed product rules

1. Enter trip information **once** (no double entry).
 2. Nothing goes to the client until an advisor has checked it (or the system has verified it).
 3. Advisors plan trips mainly by **talking in Trip Builder** (chat), not by filling endless forms.
 4. Rates should be added in the order defined by the pricing rules: **PureLuxe's preferred sources first (special, wholesale, and offline rates), followed by rates from normal supplier systems.**
 5. Client product is a **website with chat** — not WhatsApp as the main plan.
 6. Two public websites (team + guest), one shared codebase/repo.
-

PureLuxe Studio (Internal Team)

Studio is the main product for the team.

Advisors use it every day to:

- manage clients
 - build trips
 - get hotel/travel prices
 - send proposals
 - book after approval
 - track payments
 - support guests while they travel
-

What is the “Studio shell”?

The **shell** is the frame that stays on screen after login.

It is **not** a page by itself. It is the layout around every Studio page.

Example:

You click **Clients**. The sidebar stays. Only the middle area changes to the Clients page.

Sidebar map (what each area is for)

Operations (daily work)

Tab	Simple use case
Home	“What needs my attention today?”
Queue	“What did the system suggest that I must check before trusting?”
Inbox	“Which emails link to our trips/bookings?”
Bookings	“What is actually booked with hotels/suppliers?”
Trip Builder	“Build and price this client’s trip in chat.”
Trips	“Show all trips by stage (building, upcoming, travelling...).”

Tab	Simple use case
Clients	“People and families we serve.”
Trainer	“Fix client/family data by chatting.”
Tasks	“What follow-ups are due (visa, payment chase, pre-departure)?”

Commercial (money)

Tab	Simple use case
Payments	“What do clients owe / have they paid?” (deposit, balance, failed, overdue)
Commissions	“What commission should we receive from suppliers?”

Note on Rates & Suppliers:

Advisors get rates **inside Trip Builder** while planning a trip.

A separate Rates & Suppliers area is mainly for **admin setup** (which suppliers are on, which rules to use). It is explained under Settings / admin — not as a daily advisor tab.

System (admin)

Tab	Simple use case
Team & Roles	“Who can log in, and are they Advisor / Ops / Finance?”
Settings	“Company defaults, rate-source rules, document branding.”

User strip (bottom of sidebar)

Shows **name, role, email** of the person logged in.

Used to confirm identity and to sign out.

Studio pages (one by one)

For each page you will see:

- Purpose
 - Who uses it
 - How the page looks
 - Use case / example
 - Main actions
 - What happens next
 - Important statuses
-

1) Login

Purpose

Login is the **front door to Studio**.

Its job is simple and strict:

Only invited PureLuxe / KFT team members get in.
Guests never use this page.
No public “register with password.”

Login exists to solve real problems:

1. **Stop outsiders from entering the team tool**
2. **Stop shared/weak passwords** (use company Google instead)
3. **Make joining a new teammate easy** (admin invites → Google sign-in)
4. **Send each person to the right Home** based on their role

One-line product job

Sign in with work Google → if invited and active → open Studio Home for your role.

Who uses it

Person	What happens
Invited team member	Signs in → Home
Not invited / wrong account	Sees clear “no access” message
Already signed in	Skips login → goes straight to Home
Guest / client	Does not use this page (uses Client App login)

How the page should look

01.sign in

UX rules for easy use

- One main button only (no username/password form)
- Short message: team-only
- Clear failure message with next step (“ask admin”)
- No clutter, no guest signup link on this page

How the feature should work

1. User opens Studio website.
2. If already signed in and allowed → go to Home.
3. If not → show Login.
4. User clicks **Sign in with Google**.
5. System checks:
 - Is this email **invited** / **active** in Team & Roles?
 - What is their **role** (Advisor / Ops / Finance / Admin)?
6. Outcomes:

Result	What user sees
Allowed	Studio shell + Home for their role
Not invited	Access denied + ask admin
Wrong product	Never send them into Client App from here

New teammate flow (important)

1. Admin adds email + role in **Team & Roles**.
2. New person opens Studio Login.
3. Signs in with that Google account.
4. Enters Home with the correct role cards.

No self-registration form.

Real examples

Example 1 — Normal morning

Ada opens Studio → already signed in → lands on Advisor Home.

Example 2 — New hire

Admin invites `sam@kft.travel` as Ops.

Sam signs in with Google once → Ops Home with Queue cards.

Example 3 — Wrong person

Personal Gmail tries to sign in → “no access / ask admin.”

Studio data stays protected.

Main actions

- Sign in with Google
- Try another account (when denied)
- Sign out (from user strip after login)

What happens next

Allowed user → **Home (Dashboard)**.

Statuses

- Signed out
 - Signed in
 - Access denied
 - Invite pending / inactive (admin side)
-

What Login is not

- Not a client/guest login
 - Not a public registration page
 - Not a place to choose “I am advisor / I am client” on one screen
-

2) Home (Dashboard)

Purpose

Home is the **morning start page** after login.

It answers one question:

“What should I do first today?”

Home exists to solve real problems:

1. **People waste time hunting across pages** for urgent work
2. **Different roles need different first actions**
3. **Urgent client/ops/money items get missed** if everything is mixed
4. **Home must stay small** so it stays useful (not a giant report)

One-line product job

Show a few important cards for my role → click one → do the work.

Who uses it

Role	Home helps them start with
Advisor	Client replies, tasks, proposals waiting, today's arrivals
Ops	Queue to clear, today's travel, deadlines
Finance	Payments and commissions
Admin	Team access + backlog health

How the page should look

02.dashboard_page

UX rules for easy use

- A few clear cards per role
 - One short **Needs action** list (not endless)
 - Click card or row → open the exact work page
 - No charts, no dense reports on Home
 - Role decides which cards appear
-

Important cards by role

Advisor

Card	Problem it solves	Opens
Client chats waiting	Guest messaged in Client App and needs reply	That trip chat / messages
Tasks due today	Follow-ups not forgotten	Tasks
Waiting on client	Know which proposals need client response / changes	Trip Builder
Check-ins today	Prepare arrivals (VIP highlighted)	Trips / Bookings

Example: Ada sees 2 chats + 1 VIP check-in → replies first, then prepares arrival.

Ops

Card	Problem it solves	Opens
Queue pending	Untrusted extracts waiting for approve/reject	Queue
Check-ins / check-outs today	Today's live travel ops	Trips / Bookings
Deadlines this week	Avoid losing rooms/money on cancel dates	Bookings / Tasks
Tasks due today	Ops follow-ups	Tasks

Example: Ops sees 10 Queue items → clears Queue before other work.

Finance

Card	Problem it solves	Opens
Payments due	Know what to collect	Payments / trip
Failed / overdue payments	Chase problems fast	Payments / trip
Commissions expected	Track supplier payouts	Commissions

Example: Finance sees 3 overdue payments → chases those first.

Admin

Card	Problem it solves	Opens
Queue pending (team)	See if review backlog is growing	Queue
Team access	Invites / users needing setup	Team & Roles
Open tasks (team)	See if work is piling up	Tasks

Example: Admin sees invite pending + Queue rising → fixes access, checks Ops load.

How the feature should work

1. User lands on Home after login.
2. System loads **only cards for their role**.
3. Counts come from live work:
 - Client chats waiting = Client App messages with no team reply yet
 - Queue pending = items waiting in Queue
 - Tasks due = open tasks due today
 - etc.
4. User clicks the highest-priority card or list row.
5. They leave Home and finish the work on that page.

6. When done, Home counts update next time they return.

Priority habit for advisors (suggested)

1. Client chats waiting
 2. Overdue tasks
 3. Waiting on client / changes
 4. Today's check-ins
-

Real examples

Example 1 — Advisor morning

Home shows 2 chats waiting and 1 overdue visa task.
Ada clears those before opening Trip Builder for new planning.

Example 2 — Ops fire drill

Home shows Queue = 12 and 2 cancel deadlines today.
Ops clears Queue and deadline items first.

Example 3 — Finance chase day

Home shows 4 overdue payments.
Finance opens those trips and chases payment

Main actions

- View role-based cards
- Click card / list item to open work
- Return later to see updated counts

What happens next

Home → Queue / Tasks / Trip Builder / Bookings / Payments / Team & Roles.

Important signals

- Waiting on me
- Due today / overdue
- VIP check-in
- Queue pending
- Payment overdue / failed

What Home is not

- Not a full analytics dashboard
- Not a replacement for Queue, Tasks, or Trip Builder
- Not a place to edit bookings or build itineraries
- Not overloaded with every possible metric

Home = **start here**, then go do the work elsewhere.

3) Queue

Purpos

Queue is the team's "**check before trust**" inbox.

The system can suggest data from emails / AI / supplier updates.
That data is **not trusted yet**.

Queue exists to solve real problems:

1. **Wrong data must not enter Bookings/Clients**
2. **Duplicates must not create two records for one person/stay**
3. **Missing important fields must be fixed before approve**
4. **Related hotel stays should be grouped into one trip when needed**
5. **Ops needs one clear place to clear work fast** — not hunt across emails

One-line product job

Open Queue → fix or confirm → Approve → item becomes real trusted data.
Or Reject → it does not enter the system.

Who uses it

Role	How they use Queue
Ops	Main daily user — clear the pile
Advisor	Review items for their own clients when needed

What appears in Queue

Main tabs:

Tab	What it is	Real problem it solves
Bookings	Suggested hotel/stay bookings from email/extract	Bad booking details polluting Bookings
Clients	Suggested new/uncertain people	Duplicate or wrong client profiles

Email matching also connects to Inbox. Supplier updates can appear in Queue or Bookings when useful.

04.queue client page

What each booking card shows (matches Studio Queue today)

- **Header:** client name — hotel name · status (Pending / VIP if set)
- **Email source:** which inbox/account extracted it (Extracted from ...) + when · and the **source email** (subject / confirmation mail) so the reviewer knows where the data came from
- **Field grid (actual extracted data), not a separate “Problems found” list:**
 - Check-in
 - Check-out
 - Hotel ref / PNR (or LHW / Ottila / ONYX ref when that is the source)
 - Total cost + currency
 - Cancellation deadline
 - Client (linked or assign)
- Empty / missing values appear **on the field itself** (e.g. “No ref — check email”, “Required”, “Not captured”)
- Optional: short line “Required before approving: ...” only if something still blocks Approve
- Expand: city, country, chain, rooms, adults, booking source, commission %, notes
- Actions: **Edit fields** · **Reject** · **Approve** (Approve enabled when required fields + client are ready)

What each client card shows

- Name, when added, bookings linked
- Field grid: email, phone, WhatsApp, nationality, city, VIP level, notes
- Actions: **Edit fields** · **Reject** · **Approve** (merge flow only when a similar existing client is detected)

UX rules for easy use

- Show **real extracted fields** on the card so Ops can verify data at a glance
 - Always show **which email / inbox** the suggestion came from
 - Mark missing values **inline on fields** (not a separate problems list)
 - Oldest items first (aging work is dangerous)
 - Clear actions: **Edit fields**, **Approve**, **Reject**
 - One card = one decision
 - After action, card disappears and count drops
-

How the feature should work

A) Booking review flow

1. System extracts a possible booking (usually from a confirmation email).
2. It lands in **Queue** → **Bookings** as “waiting”.
3. Card shows:
 - **Email source** — which inbox extracted it, and which email (subject / confirmation)
 - **Extracted fields** — client, hotel, check-in / check-out, refs, cost, cancel deadline, etc.
 - Missing values marked **on the field** (not a separate problems list)
4. User chooses:

Action	When to use	Result
Approve	Required fields look correct and client is linked	Becomes trusted booking in Bookings
Edit fields	Small error (wrong date, missing ref, cost)	User edits on the same card → Save → then Approve
Reject	Spam, wrong extract, not a real booking	Discarded, not trusted
Link to trip (when suggested)	This stay belongs with other stays	Attached to the right trip
Open / view source email	Need to read original confirmation	Opens source mail for confidence

B) Client review flow

1. System suggests a new/uncertain person.
2. Card shows **extracted profile fields** (email, phone, WhatsApp, nationality, city, VIP).
3. If a similar existing client is detected, offer merge; otherwise approve as new.
4. User chooses:

Action	Result
Merge with existing	Keep one clean client record
Approve (as new)	Create trusted new client
Edit fields	Fix details on the same card before approve

Action	Result
Reject	Discard bad suggestion

Real examples (why Queue matters)

Example 1 — Stop bad data

Email extract sets wrong checkout date.

Ops opens Queue, sees the field grid + source email, clicks **Edit fields**, corrects checkout, saves, then **Approve**.

Trusted Bookings now has the right stay.

Example 2 — Stop duplicates

“Ravi Mehta” already exists. Extract suggests another similar profile.

Ops uses **Merge with existing** from the client card.

One client profile stays clean.

Example 3 — Clear the morning pile

Ops starts day with 12 Queue items.

Oldest first. Review fields → Edit / Approve / Reject.

Home “Queue pending” count goes down.

Team can trust Bookings and Clients again.

What makes Queue easy (product rules)

1. **Default sort = oldest first**
 2. **Cards show extracted field data + email source** (inbox + which email)
 3. **Missing values are marked on the field** (not a separate problems list)
 4. **Approve is one click when required fields are ready**
 5. **Edit happens on the same card** (no long navigation)
 6. **Reject needs almost no friction** (optional short reason later)
 7. **Mine filter** helps advisors focus on their clients
 8. **Needs fix / Duplicates filters** narrow to incomplete or similar items
-

Main actions

- Approve

- Edit fields (then Approve)
- Reject
- Merge clients
- Link / group to trip (when suggested)
- Open / view source email
- Filter: All / Mine / Needs fix / Duplicates

What happens next

After	Goes to
Booking approved	Bookings (+ trip if linked)
Client approved	Clients
Clients merged	One Client Profile
Rejected	Removed from Queue (not trusted)

Statuses

- Waiting / Pending review
 - Needs fix
 - Possible duplicate
 - Approved (trusted)
 - Rejected
 - Group suggestion available
-

What Queue is not

- Not a full email inbox (that is Inbox)
- Not Trip Builder planning
- Not the place to design itineraries
- Not a dumping ground for every notification (Home handles “needs attention”)

Queue = **quality gate only**.

4) Inbox / Correspondence

Purpose

Inbox is Studio's **email workbench for trips**.

It is **not** Gmail replacement for everything.

It is the place to find work emails and attach them to the right client / trip / booking.

Inbox exists to solve real problems:

1. **Important trip emails get lost in personal Gmail**
2. **Hard to answer: "Which trip was this email about?"**
3. **Client change requests by email need a home next to the trip**
4. **Team needs to reopen the original confirmation later** without hunting mail
5. **Emails should LINK to existing records** — not secretly create new clients/bookings by themselves

One-line product job

Find the email → confirm which trip/booking it belongs to → keep it attached for later.

How it differs from Queue

	Queue	Inbox
Main job	Approve/reject extracted data	Find and link emails
Example question	"Is this booking record correct?"	"Which trip does this email belong to?"
Result	Trusted Booking / Client	Email attached to trip / booking

Who uses it

Role	How they use Inbox
Ops	Find confirmations, amendments, invoices; confirm suggested links
Advisor	Find client emails and trip-related messages for their clients

How the page should look

UX rules for easy use

- Search by client, hotel, subject, ref
- Show link status clearly: Linked / Needs match / Unlinked
- One email = one decision about linking
- Never auto-create a new client/booking from Inbox alone

How the feature should work

A) Email arrives (background)

1. Connected mailbox syncs (shared ops inboxes).
2. Email is stored.
3. If it looks like a new booking/client extract → also creates a **Queue** item.
4. Email still remains findable in Inbox.

B) Link to existing trip/booking

1. User opens email in Inbox.
2. System may suggest: “Looks like Mehta · Tokyo trip.”
3. User chooses:

Action	When	Result
Confirm link	Suggestion is correct	Email attached to that trip/booking
Pick different trip	Suggestion is wrong	User chooses correct record
Leave unlinked	Not trip-related / unclear	Stays searchable, not attached

C) When extract is needed

If the email is a new confirmation and no Queue item exists yet:

- User can **Send extract to Queue**
- Then approve/fix in Queue as usual

D) Open from trip context

From a trip page: “Emails linked to this trip” → opens the same Inbox items filtered to that trip.

Real examples

Example 1 — Client change by email

Client writes: “Please move check-in by 1 day.”

Inbox shows **Needs match** → suggests Tokyo trip.

Advisor confirms link → updates trip in Trip Builder.

Example 2 — Find old confirmation

Ops needs the original St Regis PDF again.

Search Inbox “Mehta St Regis” → open linked email/attachment.

Example 3 — Wrong suggestion

System suggests wrong trip.

User clicks **Pick different trip**, chooses the correct one, confirms.

Example 4 — Noise

Newsletter or unrelated forward.

Leave unlinked (or ignore). No Queue card needed.

Main actions

- Search emails
- Open thread / attachment
- Confirm suggested link
- Pick different client/trip/booking
- Leave unlinked
- Send extract to Queue (when needed)
- Filter: All / Unlinked / Linked / Needs match

What happens next

After	Result
Link confirmed	Email appears on that trip’s history
Sent to Queue	Booking/client review continues in Queue
Left unlinked	No trip pollution; still searchable

Statuses

- Unlinked
 - Needs match (suggested)
 - Linked
 - Sent to Queue / already extracted
-

What Inbox is not

- Not a full personal Gmail client for all life email
- Not the approve/reject quality gate (that is **Queue**)
- Not Trip Builder
- Not a place that creates trusted bookings by itself

Inbox = **correspondence context**.

Queue = **data trust gate**.

Connected mailboxes (product rule)

Inbox/sync works for **connected shared ops mailboxes** (one or many), not automatically every KFT personal email.

Example to connect first:

- bookings@ / confirmations@
 - maybe visas@ later
-

5) Bookings

Purpose

Bookings is the **trusted list of real supplier stays and services**.

After something is approved (from Queue) or booked by the team, it lives here.

Bookings exists to solve real problems:

1. **“What is actually booked with the hotel/supplier?”**
2. **Find a stay fast** by client, hotel, dates, or confirmation ref
3. **Keep amendments and cancellations accurate**
4. **Feed Home check-ins, deadlines, payments, and Trips** with real data
5. **Stop mixing “planned ideas” with “confirmed inventory”**

One-line product job

Search and open the real booking → check or update status/refs → keep ops truth clean.

How it differs from other pages

Page	Question it answers
Trip Builder	What are we planning / proposing?
Queue	Should we trust this extracted booking yet?
Bookings	What is already booked / confirmed with suppliers?
Trips	How do several stays form one client journey?

Who uses it

Role	How they use Bookings
Ops	Main user — search, fix refs, amend, cancel, check deadlines
Advisor	Find their clients’ stays, check status before travel
Finance	Open booking for cost / commission context when needed

What is a booking here

- **Hotel / stay bookings** (primary)
- Link to client + optional trip
- Key dates, refs, cost, status, cancellation deadline
- Notes

Flights, transfers, activities can appear later as more booking types — or stay inside the trip until needed.

How the page should look

06.bookings_page

UX rules for easy use

- Fast search (name, hotel, ref)
 - Status filter people use daily: Confirmed / Pending / Cancelled / Checked out
 - Detail panel on the same page (no deep maze)
 - Clear link to the parent **trip**
 - Show deadline warnings when cancel date is near
-

How the feature should work

A) How bookings get here

Source	Path
Email confirmation extract	Queue → Approve → Bookings
Advisor booked after client approval	Created/updated from Trip Builder / booking action → Bookings
Offline specialist confirmation	Entered/updated by ops → Bookings
Amendment email	Queue or manual update → new version / status change

Pending Queue items are **not** trusted Bookings yet.

B) Daily find-and-check flow

1. User searches client / hotel / ref.
2. Opens the booking detail.
3. Checks status, dates, refs, deadline.
4. Edits if needed, or jumps to the trip.

C) Amend / cancel flow (simple)

Action	When	Result
Edit	Fix notes, ref, small field corrections	Same booking updated
Amend	Hotel changed dates/room after confirm	Status may become amendment pending; old version can be superseded
Cancel	Stay cancelled	Status = Cancelled; trip/Home update

D) After checkout

When stay end date passes, booking can move to **Checked out / completed** (auto later is fine).

Helps Home and Past trips stay clean.

Real examples

Example 1 — Find by ref

Hotel calls about HX991.

Ops searches Bookings → opens Mehta · St Regis → answers with correct dates.

Example 2 — After Queue approve

Confirmation email extracted → Queue Approve → booking appears as **Confirmed** here with ref.

Example 3 — Client approved, then book

Ada books Soneva after approval.

Booking shows **Booking pending**, then **Confirmed** when supplier confirms.

Example 4 — Deadline risk

Home shows deadline this week.

Ops opens Bookings, sees cancel-by date tomorrow, decides with advisor whether to keep or cancel.

Example 5 — Amendment

Hotel changes checkout.

Ops amends booking (or approves amendment from Queue).

Trip dates stay aligned.

Main actions

- Search and filter
- Open detail panel
- Edit key fields (dates, refs, cost, notes, VIP flags)
- Link / open related trip and client
- Amend or cancel

- Open source email when available

What happens next

Trusted bookings power:

- Home check-ins / check-outs / deadlines
- Trips (legs of a journey)
- Payment and commission context
- Client App status (guest-safe view of confirmed stays)

Statuses

Status	Meaning
Pending	Not fully confirmed yet
Confirmed	Supplier-confirmed stay
Cancelled	Not travelling on this booking
Checked out	Stay finished
Superseded	Replaced by a newer amendment version

Also used when needed: Enquiry, Hold, Failed, Amendment pending.

What Bookings is not

- Not the place to design day-by-day itinerary (Trip Builder)
- Not the approve gate for AI extracts (Queue)
- Not a full finance ledger (Commissions / Payments pages)
- Not the guest Client App

Bookings = **ops inventory truth for stays/services.**

6) Trips

Purpose

Trips is the **journey list**.

One trip = one client holiday story.
It can include several hotels/days, but the team still sees **one trip**.

Trips exists to solve real problems:

1. **“Where is this client’s holiday overall?”** (not only one hotel row)
2. **Find trips by stage** — building, waiting on client, upcoming, travelling, past
3. **Jump into the right work** — Trip Builder, bookings, client
4. **Stop treating connected stays as unrelated bookings**

One-line product job

Find the trip by stage → see next action → open Trip Builder or bookings.

How it differ

Page	Question
Bookings	What single stay is booked?
Trips	What is the full client journey?
Trip Builder	Build/edit that journey in chat

Who uses it

Role	Use
Advisor	Find my trips by stage and continue work
Ops	See upcoming/active travel and linked stays

How the page should look

07.trips_page

UX rules

- Tabs by stage (not a giant unfiltered list)
- Each card shows **status** + **next action**
- One click into Trip Builder

How it should work

1. User opens a stage tab (example: Waiting on client).
2. Sees trip cards with next action.
3. Opens Trip Builder to continue, or Bookings for supplier truth.
4. When stage changes (proposal sent, approved, confirmed), trip moves tabs.

Trip statuses

Status	Meaning
Building	Still planning
Waiting on client	Proposal sent / changes / approval pending
Booking	Approved — booking in progress
Upcoming	Confirmed, travel not started
Active	Client is travelling
Past	Completed
Cancelled	Stopped

(Payment pending can show as a badge on the card.)

Real examples

Example 1 — Ada filters **Waiting on client**, opens Agarwal, handles change request in Trip Builder.

Example 2 — Ops opens **Active**, checks who is in-hotel today.

Example 3 — Two hotel bookings grouped earlier → one Japan trip card.

Main actions

- Filter by stage / search / mine
- Open Trip Builder
- Open client or bookings

What Trips is not

- Not the chat planning workspace (Trip Builder)
 - Not the Queue approve gate
 - Not a finance page
-

7) Clients

Purpose

Clients is the **people CRM**.

It stores who the guest is, VIP level, preferences, family, and history — so every trip is personal.

Clients exists to solve real problems:

1. **Find the right person fast**
2. **Avoid duplicate people**
3. **Keep family/travel party clear**
4. **Carry preferences into Trip Builder and Client App chat**
5. **Start a trip from a clean profile**

One-line product job

Find client → check VIP/preferences/family → edit if needed → start trip.

Who uses it

Advisors (main), Ops (cleanup/merge).

How the page should look

08.client page

How it should work

Action	Result
Search	Find by name/email/phone
Edit	Update contacts, VIP, preferences, notes
Merge	Two records → one person
Manage family	Link spouse/children/roles
Start trip	Open Trip Builder for this client

New clients can also be created from Trip Builder **only after advisor confirms** no match.

Real examples

Example 1 — Before planning, Ada opens Mehta: VIP, pescatarian, spouse travelling → Start trip.

Example 2 — Duplicate “R. Mehta” → Merge.

Example 3 — Queue approved a new client → appears here as trusted.

What Clients is not

- Not itinerary builder
 - Not Queue (pending people stay in Queue until approved)
-

8) Trainer

Purpose

Trainer is a **CRM chat helper** for client/family data.

It helps clean links and fields by conversation — **not** build itineraries.

Trainer exists to solve:

1. Family linking is slow with many forms
2. Advisors need quick lookup/update of CRM facts
3. Conflicts need human confirmation (never invent family from surname alone)

09.trainer page

One-line product job

Ask in chat → confirm when unsure → client/family data updates.

9) Trip Builder (core planning page)

Purpose

Trip Builder is the **main advisor workspace** to create and build a trip by chat.

This is where hotel options are chosen, sell price is set, and itinerary / rate PDFs are prepared — all on **one trip**.

Trip Builder exists to solve:

1. Planning by endless forms is slow
2. Itinerary + rates + docs must stay on **one trip**
3. Advisor must review before anything reaches the client
4. Rates must use PureLuxe's best commercial sources first

One-line product job

Chat to build the trip → Overview shows truth → Rates & pricing locks sell → Proposal ready as PDFs.

Who uses it

Advisors (primary).

Screen layout (final design)

Three columns always:

1. **App sidebar** — PureLuxe Studio navigation (Trip Builder active)
2. **Chat (centre)** — main way of working; hotel options can show as cards with photos
3. **Trip sidebar (right)** — living trip truth with **only three tabs**: Overview · Rates & pricing · Proposal

11.trip builder with rate&pricing page

12.trip builder with proposal tab

UX rules

- Chat is the main way of working
- Right sidebar is the living trip truth (keep it short and scannable)
- Hotel options appear in **chat** (with image when available) **and** in **Rates & pricing**
- Margin is **team only** — Client App never sees it
- Client sees prices / proposal only after the advisor is ready to publish (outside this three-tab prep flow)

Sidebar tabs (V1 — three only)

1) Overview

Job: Instant “where is this trip?” without re-reading chat.

Shows (as designed)

- Status: Building · Client · VIP
- **Next action** callout (e.g. “Set sell price & publish proposal”)
- **Travelers** (e.g. Ravi Mehta · Priya Mehta spouse)
- **Trip leg** (e.g. Maldives · 10–15 Oct · 5 nights) with destination thumb when available
- **Selected stay** (e.g. Soneva Fushi ★ · Client sell USD 12,200)
- **Team only** (locked): Cost · Margin
- Buttons: **Open Rates & pricing** · **Open Proposal**
- Note: Client App sees prices only after Publish

Use case: Ada returns to the trip and sees next step + selected stay without scrolling chat.

2) Rates & pricing

Job: Compare options, select one, set sell / margin / payment plan, lock for proposal.

Shows (as designed) — see section 10 for full detail.

3) Proposal

Job: Prepare **Itinerary PDF** and **Rate PDF** — download, preview, edit, regenerate.

Shows (as designed) — see section 11 for full detail.

No separate “Share with client” block on this tab in the current design (docs prep only).

End-to-end example (Mehta · Maldives) — how the three screens work together

Goal: Ada builds a Maldives trip for VIP client Ravi Mehta, selects Soneva, locks sell price, and prepares itinerary + rate PDFs.

Step	Where	What happens
1	Chat	Ada: “Start trip Mehta Maldives Oct 10–15.” Assistant starts trip and shows two hotel cards with photos: St Regis (USD 9,800 · Wholesale) and Soneva Fushi (USD 10,800 · Specialist).
2	Chat	Ada selects Soneva Fushi . Assistant confirms: “Excellent choice...”
3	Overview	Sidebar updates: travelers Ravi + Priya; leg Maldives 10–15 Oct; selected stay Soneva; client sell USD 12,200; team-only cost 10,800 · margin 1,400. Next action: “Set sell price & publish proposal.”
4	Rates & pricing	Ada opens the tab (or clicks Open Rates & pricing). Same two options listed; Soneva selected. She confirms sell \$12,200 , payment plan Deposit 40% / Balance 60%, clicks Lock for proposal .
5	Proposal	Trip truth shows Locked sell \$12,200. Itinerary PDF and Rate PDF are Ready. Ada Previews, Downloads if needed, Edits wording if required, then Regenerates . If she later changes dates/rates, files show STALE → Regenerate.
6	After docs are ready	Advisor shares/publishes to the client through the agreed client flow (Client App / email). Guests never see margin.

Same story in one line

Chat selects Soneva → Overview shows truth → Rates & pricing locks sell \$12,200 → Proposal prepares Itinerary + Rate PDFs.

Happy path (short)

1. Start trip for existing client (+ companions).
2. Add destination / dates in chat.
3. Compare hotel options (chat cards and/or Rates & pricing).
4. Select option → set sell → **Lock for proposal**.

5. In **Proposal**, generate / download / edit / regenerate Itinerary PDF + Rate PDF.
6. When ready, share with client (publish / email as product allows).
7. Handle changes on the **same trip**; regenerate stale PDFs.
8. After approval → book → final itinerary later.

Main actions

- Start trip / add travelers
- Select hotel options in chat
- Open Rates & pricing → set sell → lock
- Open Proposal → download / preview / edit / regenerate PDFs

What Trip Builder is not

- Not Queue
- Not guest Client App chat (similar feel, different product)
- Not commission reconciliation

10) Rates & pricing (inside Trip Builder) + admin setup

Purpose

Rates & pricing is the second Trip Builder sidebar tab. It covers both:

1. **Rates** — “What can we offer this client, for these dates, at what cost?”
2. **Pricing** — “What does the client pay?” (margin stays team-only)

One-line product job

Compare options (with photos) → select one → set sell / payment plan → Lock for proposal.

Admin rate setup stays in **Settings** (which suppliers / rules) — not a daily advisor tab.

Who uses it

Advisors (daily). Ops may paste specialist/offline quotes.

Where it appears

Place	What shows
Chat	Hotel option cards with image when available — select in conversation
Rates & pricing tab	Full options list + sell / margin / Lock for proposal
Overview	Selected stay + client sell only; team-only cost/margin summary
Proposal	Uses locked sell for Rate PDF / Itinerary PDF
Client App	Sell price only — never margin

Button meanings

Control	What it does
Search suppliers	Stays on this tab; refreshes options from connected suppliers for this trip's dates/destination (does not open Settings or a separate Rates page)
Paste offline quote	Adds a specialist / offline quote when there is no live API
Option radio / check	Selects the stay that becomes cost basis
Sell to client	Sets client package price; margin recalculates
Lock for proposal	Freezes selected stay + sell for Proposal PDFs

Use case + example

Rates: Ada compares St Regis vs Soneva (same options as in chat). She keeps **Soneva** selected. If she needs fresher live prices, she clicks **Search suppliers** and the list refreshes on this tab.

Pricing: Cost 10,800 → *shesetssell* **12,200** (margin 1,400) → *paymentplan*40/60 → ***Lockforproposal* ***.OverviewandProposalthenuse*12,200.

How it works

1. Open **Rates & pricing** (or arrive from Overview button).
2. Review options (synced with chat selections).
3. Optionally **Search suppliers** (refresh) or **Paste offline quote**.
4. Select one option.
5. Set sell + payment plan; confirm margin (team only).
6. **Lock for proposal** → Proposal tab can prepare PDFs.

Sources (priority idea)

PureLuxe special / wholesale / offline first → then normal supplier systems (per Settings).

Main actions

- Search / paste / compare / select
- Set sell and payment plan
- Lock for proposal

What Rates & pricing is not

- Not Settings (supplier admin)
- Not Proposal document download (section 11)
- Not Bookings
- Margin never shown to guests

Remember

Chat = choose and talk.

Rates & pricing = confirm cost + lock sell.

Proposal = prepare PDFs from locked truth.

11) Proposal (inside Trip Builder)

Purpose

The **Proposal** tab prepares **client-ready files** from locked trip truth:

1. **Itinerary PDF** — day-by-day / proposal narrative
2. **Rate PDF** — selected stay and client sell presentation

V1 keeps **only three tabs**: Overview · Rates & pricing · Proposal.

This tab is for **document prep** (download / preview / edit / regenerate). Share/publish to the client happens when the advisor is ready through the agreed client flow — not as a cluttered block on this tab in the current design.

One-line product job

After sell is locked → generate Itinerary PDF + Rate PDF → download / preview / edit / regenerate.

Solves:

- Inconsistent Word/PDF packs
- Sending unfinished plans
- Trip changed but old PDF still used (**stale**)
- Quick **download** without leaving Trip Builder

Where it appears

Place	Role
Proposal tab	Itinerary PDF + Rate PDF with Download / Preview / Edit / Regenerate
Overview	Next action / Open Proposal when ready
Rates & pricing	Changing stay or sell may mark PDFs STALE
Chat	Content updates; files still managed here

Button meanings

Button	What it does
Download PDF	Download itinerary or rate PDF
Preview	On-screen check
Edit	Update copy / presentation (then regenerate from current truth)
Regenerate	Rebuild PDF from current trip truth (required after edits or when STALE)

Use case + example

Ada locks sell in Rates & pricing → opens **Proposal** → both PDFs **Ready** → **Preview** / **Download** → **Edit** itinerary wording if needed → **Regenerate**.
 Later she changes dates in chat → Rate PDF shows **STALE** → **Regenerate**.

How it works

1. Selected stay + sell locked in Rates & pricing.
2. Generate **Itinerary PDF** and **Rate PDF**.
3. Download / Preview / Edit as needed.
4. Regenerate after edits or when STALE.
5. When docs are good, advisor shares with client through the agreed publish/email flow.
6. After booking confirmed, a **final itinerary** pack can be generated later in the same tab.

Statutes (per file)

Draft · Ready · Stale · Published · Sent

Main actions

- Generate itinerary / rate PDF
- Download · Preview · Edit · Regenerate

What Proposal is not

- Not a fourth sidebar tab
- Not the place to set margin (Rates & pricing)
- Not Queue or Inbox

Remember

Overview = where you are.

Rates & pricing = what we offer and what client pays.

Proposal = Itinerary + Rate PDFs ready to download and keep fresh.

12) Tasks

Purpose

Tasks is the **follow-up to-do list across trips**.

It is **not** the itinerary and **not** Trip Builder chat.

It is the place to clear ops/advisor follow-ups so nothing important is forgotten after proposal or booking.

Examples of tasks

- Confirm visa
- Chase balance / deposit payment
- Book airport transfer
- Send pre-departure pack

One-line product job

See what is due (especially today / overdue) → mark done or open the trip and finish the work.

Solves: important follow-ups forgotten after proposal/booking.

Important: While the advisor works in **Trip Builder**, some important tasks are **automatically created** in the Tasks section at key trip moments — so the follow-up list stays filled without manual entry for every standard step.

Who uses it

Role	How they use Tasks
Advisor	Visa, pre-departure, client follow-ups on their trips
Ops	Transfers, supplier chase items linked to trips
Finance	Payment chase tasks when surfaced here or from Home

How the page should look

13.tasks page

UX rules (easy to use)

- Default to **My tasks** so the list stays personal and short
- Clear due signals: **Overdue** (urgent) · **Today** · later dates
- Every task links to a **trip** (Open trip)
- Checkbox / **Mark done** clears the item without leaving the list
- + **New task** for manual follow-ups when needed

Filters

Filter	Meaning
My tasks	Assigned to / owned by the signed-in person (default)
Due today	Due on today's date
Overdue	Past due — clear these first
This week	Due within the current week

Filter	Meaning
All	Full list (still scannable by due badge)

Main actions

Action	Result
Mark done	Task completed; drops off open filters
Open trip	Jump to that trip (Trips / Trip Builder) to finish the work
+ New task	Manually create a follow-up linked to a trip
Checkbox	Same as mark done (quick complete)

How it works

1. **During Trip Builder**, some important follow-ups are **automatically created** in the Tasks section when the trip hits key moments (examples: proposal sent → chase client reply; sell locked / booking started → visa or deposit chase; booking confirmed → pre-departure pack / transfer). Advisors do not have to remember to add every one of these by hand.
2. More tasks can also be **auto-created** from later trip stages or payment events (e.g. payment overdue → chase balance).
3. Advisors/ops can still **create** tasks manually (+ **New task**) when something else must not be forgotten.
4. User opens **Tasks**, usually on **My tasks** or **Overdue**.
5. For each row: **Mark done** if finished, or **Open trip** to do the work in context.
6. Home “Tasks due today” counts stay in sync when tasks are completed.

Example — how it works (Ada’s morning)

1. Ada opens **Tasks** → filter **My tasks**.
2. She sees **Overdue (1)**: Confirm Japan visa · Kapoor · Tokyo.

3. She clicks **Open trip**, confirms visa status with the client/docs, returns and clicks **Mark done**.
4. **Today:** Send pre-departure pack · Mehta · Maldives → she sends the pack from the trip, then **Mark done**.
5. **Today:** Chase balance payment · Agarwal → she opens the trip / payment context, chases, leaves the task open until paid (or marks done when chase is complete).
6. Later she adds + **New task:** “Confirm spa booking” linked to Mehta Maldives, due Wednesday.

Result: Follow-ups are cleared in one list; trip work still happens on the trip — Tasks only tracks what is still owed.

Statuses

Open · Due today · Overdue · Done

What Tasks is not

- Not the day-by-day itinerary (Trip Builder)
- Not Queue (data trust gate)
- Not a full project-management tool
- Not Payments ledger (Payments page / trip payment panel owns money truth)

Remember

Tasks = what I must follow up.
Trip Builder / Trips = where I do the trip work.
Home = reminds me tasks are due today.

13) Payments

Purpose

Payments tracks **what the client owes and has paid** (client → PureLuxe).

It is **not** Commissions (supplier → PureLuxe).

It is the team's **chase list** for deposits, balances, failed charges, and overdue amounts — also surfaced on Home for Finance/Advisor.

One-line product job

See what needs chase (overdue / due soon / failed) → open the trip → record payment or follow up.

Solves:

- Deposit / balance chase
- Failed payments
- Knowing when money is clear before travel messaging

Who uses it

Role	How they use Payments
Finance	Main daily user — clear overdue and failed first
Advisor	See their clients' pending / overdue amounts; open trip to chase
Ops	Check money is clear before travel ops messaging when needed

Nav: under **Commercial** next to Commissions (client money ≠ supplier commissions).

Overdue

Due this week

Failed

\$4,800

\$2,000

1

Needs action

Overdue

Due soon

Failed

Paid

All

Mine

Trip / client	Type	Due	Status	Amount	Actions
Mehta · Maldives	Deposit	Wed OVERDUE	Overdue	\$4,800	Open trip Record payment
Agarwal · Maldives & Dubai	Balance	Fri	Pending	\$2,000	Open trip Record payment
Kapoor · Tokyo	Deposit	—	Failed	\$3,100	Open trip Retry / Record payment
Shah · Soneva	Full	—	Paid	\$6,200	Open trip

Automatic due/overdue reminders email clients · this page is for team chase. Pay-at-hotel shows as status when used.

14.payment page

UX rules (easy to use)

- Morning glance: summary chips for **Overdue** · **Due this week** · **Failed**
- Default filter **Needs action** (overdue + due soon + failed) — not a long “everything paid” list
- Each row links to the **trip**
- Clear actions: **Open trip** · **Record payment** (or Retry when Failed)
- Keep it a **worklist**, not a heavy analytics dashboard

Filters

Filter	Meaning
Needs action	Overdue + due soon + failed (default for chase day)
Overdue	Past due date
Due soon	Due this week / coming due

Filter	Meaning
Failed	Payment attempt failed
Paid	Fully paid (history / confirmation)
All	Full list

Main actions

Action	Result
Open trip	Jump to the trip to chase in context
Record payment	Mark amount paid / update status in Studio
Retry (failed)	Re-attempt or re-issue payment path when failed

How it works

1. After client **approval**, a payment schedule exists (e.g. deposit 40% / balance 60% from Rates & pricing).
2. Client pays in the **Client App**, or follows **pay-at-hotel** instructions when that is the plan.
3. Studio status updates: Pending · Partially paid · Paid · Failed · Overdue · Pay at hotel.
4. **Automatic** payment due / overdue reminder emails go to the client (see Emails section).
5. Finance/Advisor uses **Payments** (and Home cards) to chase what is still open and **Record payment** when money clears.

Example — how it works (Finance chase morning)

1. Priya (Finance) opens **Payments** → sees chips: Overdue 4,800 **, *Duethisweek* **2,000, Failed 1.
2. Filter **Needs action** shows Mehta deposit **Overdue \$4,800** first.

3. She clicks **Open trip**, confirms the client was reminded (auto overdue email already sent), calls/chats follow-up.
4. Client pays → she clicks **Record payment** → row moves toward **Paid**; Home “Payments due” count drops.
5. Next: Agarwal balance **Pending \$2,000** due Friday — she leaves it under Due soon until closer to due date.
6. Kapoor deposit **Failed \$3,100** → **Retry / Record payment** after the client uses another method.
7. Shah **Paid \$6,200** stays visible under Paid only when she checks history — not in Needs action.

Result: Team knows exactly what to chase today; clients get automatic reminders; Studio stays the truth for “is money clear before travel?”

Statuses

Payment pending · Partially paid · Paid · Failed · Pay at hotel · Overdue

What Payments is not

- Not **Commissions** (supplier payouts to PureLuxe)
- Not Trip Builder pricing (that sets sell / payment plan on the trip)
- Not a full accounting ledger / bank reconciliation tool
- Not the Client App checkout screen (guests pay there; team chases here)

Remember

Payments = what the **client** owes PureLuxe.
Commissions = what **suppliers** owe PureLuxe.
Home = quick “payments due / overdue” cards → this page for the full chase list.

14) Commissions

Purpose

Commissions tracks money **suppliers should pay PureLuxe** (supplier → PureLuxe).

It is **not** Payments (client → PureLuxe).

It gives Finance visibility: **expected vs received**, what is still outstanding, what is overdue, and where amounts don't match (variance).

One-line product job

See expected / outstanding / overdue commissions → open the booking → record received (or resolve variance).

Solves:

- Knowing what commission is owed on confirmed stays
- Chasing suppliers who have not paid yet
- Spotting short-pays / variances vs expected

Who uses it

Role	How they use Commissions
Finance	Main daily user — chase overdue, record received, resolve variance
Advisor	Check expected commission on their bookings when needed
Ops	Confirm booking/ref context when Finance asks about a line

Nav: under **Commercial** next to Payments.

How the page should look (matches design)

15.commissions page

UX rules (easy to use)

- Morning glance: **Expected · Outstanding · Overdue** chips
- Default **Needs chase** (overdue + expected due + variance) — not a long “all received” dump
- Each row links to the **booking** (and trip context)
- Clear actions: **Open booking · Record received · Resolve** (variance)
- Worklist first — not a heavy analytics dashboard

Filters

Filter	Meaning
Needs chase	Overdue + still-expected items that need attention + variance (default)
Expected	Commission projected / not yet received

Filter	Meaning
Overdue	Past expected pay date, still unpaid
Received	Fully received / reconciled
Variance	Received amount differs from expected (short-pay or over-pay)
All	Full list

Main actions

Action	Result
Open booking	Jump to the booking (and trip) for refs / dates / supplier context
Record received	Log that supplier paid; update status to Received (enter amount if needed)
Resolve (variance)	Accept variance, dispute short-pay, or correct expected after investigation

How it works

1. When a booking is trusted/confirmed (often after Queue approve or booking confirm), an **expected** commission can be created from rate / booking fields (or entered by Finance).
 2. Status starts as **Expected** (or similar).
 3. When the expected pay window passes with no receipt → **Overdue** (Needs chase).
 4. Finance opens the row → **Open booking** if they need hotel ref / checkout proof → **Record received** when the supplier pays.
 5. If the paid amount ≠ expected → **Variance** → **Resolve** (accept, chase shortfall, or correct).
 6. Home Finance cards / reports can summarize outstanding; this page is the full chase list.
-

Example — how it works (Finance commission morning)

1. Priya (Finance) opens **Commissions** → chips show Expected 18,400 **, *Outstanding* * *7,200, Overdue 2.
2. Filter **Needs chase** puts **Mehta · St Regis** first (**Overdue \$1,620**).
3. She clicks **Open booking**, checks hotel ref and checkout, confirms the claim was filed, then chases the supplier.
4. Payment arrives → **Record received** \$1,620 → status **Received**; outstanding chip drops.
5. Next: **Agarwal · One&Only** still **Expected \$2,100** (not overdue yet) — leave until pay window.
6. **Kapoor · Aman** shows **Variance**: expected 890, *received* 770 (−\$120). She clicks **Resolve**, notes short-pay, either accepts or chases the difference.
7. **Shah · Soneva** already **Received \$1,450** — only visible under Received / All, not Needs chase.

Result: Finance always knows what suppliers still owe PureLuxe, what is late, and what doesn't match — without mixing it up with client Payments.

Statuses

Expected · Overdue · Received · Variance · Cancelled (if booking cancelled / non-commissionable)

What Commissions is not

- Not **Payments** (client deposit/balance owed to PureLuxe)
- Not Trip Builder pricing / margin on the sell price (commercial sell is separate; commission is supplier payout)
- Not a full accounting GL / bank feed tool
- Not advisor payroll splits in V1 (can come later if needed)

Remember

Payments = client → PureLuxe.

Commissions = supplier → PureLuxe.

Needs chase = overdue + open expected + variance — clear those first.

15) Emails to clients (manual proposal vs automatic reminders)

Purpose

There is **no separate Notifications page** and **no email tracking screen** in this product design.

Emails work in two ways:

Type	How it is sent	Examples
Manual	Advisor sends when ready	Proposal email
Automatic	System sends on reminder / urgent events	Payment due, overdue, other important reminders

One-line product job

Advisor manually sends proposal emails.
System automatically sends reminder and urgent emails only.

A) Manual email — Proposal (advisor sends)

When the proposal document is ready, the advisor **chooses to send** the proposal email to the client.

- Not sent automatically just because the file was generated
- Advisor controls timing and when the client is notified
- Can happen from Trip Builder **Proposal** tab (example: **Send proposal email**)

Example:

Ada finishes quality check → clicks **Send proposal email** → client receives proposal link/file.

B) Automatic emails — reminders & important alerts only

These run **by themselves** when the condition is true.
No manual send step each time.

Automatic reminder emails

- Payment **due** reminder
- Payment **overdue** reminder
- Other important reminder/alert emails (example: travel approaching / urgent payment failed)

Manual (not automatic)

- Proposal ready email → **manual**
 - General marketing / custom one-off emails → out of scope
-

How it works (simple)

Proposal

1. Advisor generates/publishes proposal in Trip Builder.
2. Advisor clicks **Send proposal email** (manual).
3. Client receives email.

Reminders

1. System sees payment due / overdue (or other reminder rule).
 2. System sends reminder email automatically.
 3. No Notifications page to review send history.
-

Real examples

Example 1 — Manual proposal

Ada is ready → sends proposal email herself → client opens it.

Example 2 — Automatic reminder

Deposit due date arrives → client gets payment reminder email automatically.

Example 3 — Automatic overdue

Deposit still unpaid after due date → overdue reminder email goes out automatically.

What this is not

- Not a Notifications page
- Not send/delivery tracking dashboard
- Not automatic proposal emails
- Not SMS (can be added if needed)

Home still shows in-app work cards (chats, tasks, queue). That is separate.

16) Team & Roles

Purpose

Team & Roles controls **who can enter Studio** and **what each role is allowed to do** in each module.

It solves access control **without public registration**: only invited, active people sign in with Google.

One-line product job

Invite teammate + assign role → (optional) edit that role's module actions → they Google sign-in → Home/nav match their permissions.

Two jobs on one page (two tabs)

Tab	Job
Members	Who can log in? Invite, role, active / pending / inactive
Role permissions	What can Advisor / Ops / Finance / Admin do in each module?

Permissions are **by role** (not one-off per email) in V1 — keep Studio simple and safe.

Who uses it

Admin (primary). Others do not manage team access.

Nav: under **System** (next to Settings).

How the page should look

Tab A — Members

16.team&role page with member tab

Tab B — Role permissions

Master–detail (not one giant matrix on the Members list):

17.team&role page with role permission tab

UX rules

- **Members** = people; **Role permissions** = policy for everyone with that role
- Select a role on the left → edit its action list per module on the right
- + **Add action** adds an allowed action to that module for the selected role
- Toggles turn actions on/off; **Save changes** applies to all members with that role
- Do not put the full permissions editor on the same scroll as the member table

Roles (fixed in V1)

Advisor · Ops · Finance · Admin

(Custom roles can come later if needed.)

Main actions

Tab	Action	Result
Members	Invite member	Email + role → pending invite
Members	Change role	Person gets that role's permissions
Members	Deactivate	Cannot sign in / no Studio access
Members	Resend / Revoke	Pending invite again or cancel
Role permissions	Select role	Load that role's module actions
Role permissions	Toggle / + Add action	Change what the role can do
Role permissions	Save changes	All members with that role get the update

How it works

Members

1. Admin invites email + role (e.g. `sam@kft.travel` · Ops).
2. Invite appears under **Pending**.
3. Person signs in with **Google** using that email.
4. If invited and **Active** → Studio opens; Home/nav match role permissions.
5. If not invited / inactive → access denied (ask admin).
6. When someone leaves → **Deactivate**.

Role permissions

1. Admin opens **Role permissions**, selects e.g. **Advisor**.
2. Reviews module action lists (Trip Builder, Queue, Clients, Payments, ...).
3. Toggles actions or clicks + **Add action** for a module.
4. **Save changes** — every Advisor gets the new policy.
5. Changing a person's role on **Members** switches them to that role's saved action set.

Example — how it works (end-to-end)

1. Ria (Admin) opens **Team & Roles** → **Members** → **Invite member**:
`new.hire@kft.travel` as **Advisor**.
2. Invite shows under **Pending**. New hire signs in with Google → becomes **Active** Advisor; sees Advisor Home / Trip Builder / Clients per current Advisor permissions.
3. Ops asks for Advisors to view Queue but not approve. Ria opens **Role permissions**, selects **Advisor**.
4. Under **Queue**: keeps **View queue** on, leaves **Approve booking** off (or turns it off).
5. She clicks + **Add action** under Clients if needed (e.g. add “Merge” only for Admin later).
6. **Save changes**. All Advisors immediately follow the updated Queue rules.
7. Sam is promoted: on **Members**, Ria **Change role** Sam → **Ops**. Sam now gets Ops module actions (e.g. Queue approve), not Advisor’s.
8. Contractor leaves: **Deactivate** — Google sign-in no longer enters Studio.

Result: People are managed on Members; what each role can do is managed on Role permissions — without public registration or per-person permission chaos.

Statuses (people)

Active · Pending invite · Inactive / Deactivated

What Team & Roles is not

- Not a client/guest login area
- Not per-person custom permissions in V1 (role-based only)
- Not Settings (company defaults / suppliers / branding)
- Not public self-registration

Remember

Members = who gets in and which role.
Role permissions = what that role can do in each module.
Login = Google + invited + active.

17) Settings

Purpose

Settings holds **company defaults** — rules and setup that apply across Studio, **not** one trip.

Admins use Settings to configure **branding, rate-source rules, and connected shared mailboxes**.

Advisors work daily in Trip Builder / Queue — they do not live in Settings.

One-line product job

Set company defaults once → Trip Builder docs, rate search, and Inbox follow those rules every day.

Solves:

- Consistent proposal / itinerary branding
 - Clear rate-source preference (special / wholesale / offline before normal APIs)
 - Which shared ops mailboxes feed Inbox / extracts
-

Who uses it

Admin (primary). Not a daily advisor workspace.

Nav: under **System** (next to Team & Roles).

How the page should look (matches design)

Settings uses a **secondary nav + content** layout.
Inner nav has **three tabs only** (no Payments & booking tab):

Branding

The screenshot shows the 'Settings' page in 'PURELUXE STUDIO'. The left sidebar contains a secondary navigation menu with sections: OPERATIONS (Home, Queue, Inbox, Bookings, Trip Builder, Trips, Clients, Trainer, Tasks), COMMERCIAL (Commissions), and SYSTEM (Team & Roles, Settings). The 'Settings' tab is selected. The main content area is titled 'Settings' and includes a search bar and a '[New Trip]' button. Below the title is a sub-header 'Company defaults · Admin only'. A left-hand inner navigation menu lists 'Branding' (selected), 'Rate sources', and 'Connected mailboxes'. The 'Branding' section is titled 'Document branding' and contains three form fields: 'Company name' (filled with 'PureLuxe / KFT'), 'Logo' (with an 'Upload logo' button and file format instructions: PNG, SVG or JPG. Max 2MB), and 'Accent colour' (a color picker showing '#E7E2D9'). Below these is a 'Proposal footer' text area containing the text: 'Thank you for choosing PureLuxe. We look forward to crafting an exceptional travel experience for you.' A note below the footer states 'Used on itinerary and rate PDFs'. A 'Save changes' button is at the bottom right.

18.settings page with branding tab

Rate sources

19.settings page with rate sources tab

Connected mailboxes

20.settings page with connected mailboxes tab

UX rules

- Find one setting fast via inner nav
 - Company scope, not trip scope
 - **Save changes** on Branding / Rate sources
 - Mailbox connect/disconnect can apply immediately
 - Advisors use Trip Builder daily; Settings is setup only
-

Main actions

Action	Result
Edit branding	New proposals / itinerary PDFs use updated brand
Set rate-source rules	Trip Builder Search suppliers / paste follow company preference
Connect / disconnect mailbox	Inbox sync and extracts use that shared inbox
Save changes	Company defaults update for the whole team

How it works

1. Admin opens **Settings**.
 2. Chooses **Branding**, **Rate sources**, or **Connected mailboxes**.
 3. Edits fields / toggles / connections.
 4. Saves (or connects mailbox).
 5. Studio features read those defaults going forward:
 - Proposal PDFs → branding
 - Trip Builder rates → source rules + offline paste allowed
 - Inbox / Queue extracts → connected mailboxes
-

Example — how it works

1. Ria (Admin) opens **Settings** → **Branding**, uploads the PureLuxe logo, sets footer text, **Save changes**.
2. Next Mehta proposal PDFs from Trip Builder show the new logo automatically.
3. She opens **Rate sources**, confirms **Allow offline paste** and **Maldives wholesale first**, saves.
4. Ada in Trip Builder clicks **Search suppliers** for Maldives — wholesale options are preferred; she can still **Paste offline quote**.
5. Ria opens **Connected mailboxes**, connects `confirmations@kft.travel`.
6. Hotel confirmation email arrives in that inbox → appears in Inbox / may create a Queue item — without anyone connecting personal Gmail.

Result: Company rules live in one Admin place; daily trip work stays in Trip Builder / Queue / Payments.

What Settings is not

- Not a daily advisor workspace
- Not Team & Roles (people and permissions)
- Not Trip Builder Rates & pricing for one client trip
- Not Payments or Bookings policy pages (no Payments & booking tab here)
- Not a place to edit a single booking or proposal content

Remember

Settings = company defaults (Branding · Rate sources · Connected mailboxes).
Trip Builder = this client's trip.
Team & Roles = who can log in and what roles can do.

Internal team workflow (start to finish)

Example story: Mehta Maldives trip

1. Open/create **Client** (Mehta).
2. Capture needs in **Trip Builder**.
3. Create trip + companions.
4. Build itinerary days.
5. Get **Rates** (API/offline) → select.
6. Set **Pricing**.
7. Generate **Proposal** → publish.
8. Client reviews in Client App → requests change.
9. Ada updates same trip → republish.
10. Client **Approves**.
11. Team **Books** → confirmation may also pass **Queue**.
12. Track **Payment**.
13. Trip **Confirmed** → final itinerary published.
14. **Tasks** + support during travel.
15. Trip **Past** → commission tracked.
